

Challenge 1

Plane Programming

Challenge Overview: Use the skills you learned in the driving simulation to fly a plane around obstacles in the sky. You will have to get the user's input from the up and down arrows in order to control the plane's pitch up and down. You will also have to make the camera follow alongside the plane so you can keep it in view.

Challenge Outcome:

- The plane moves forward at a constant rate
- The up/down arrows tilt the nose of the plane up and down
- The camera follows along beside the plane as it flies

Challenge Objectives: In this challenge, you will reinforce the following skills/concepts:

- Using the Vector3 class to move and rotate objects along/around an axis
- Using Time.deltaTime in the Update() method to move objects properly
- Moving and rotating objects in scene view to position them the way you want
- Assigning variables in the inspector and initializing them in code
- Implementing Input variables to control the movement/rotation of objects based on User input

Challenge Instructions:

- Open your **Prototype 1** project
- **Download** the "Challenge 1 Starter Files" from the Tutorial Materials section, then double-click on it to **Import**
- In the *Project Window* > *Assets* > *Challenge 1* > **Instructions** folder, use the Outcome video as a guide to complete the challenge

Challenge	Task	Hint
1 The plane is going backwards	Make the plane go forward	<code>Vector3.back</code> makes an object move backwards, <code>Vector3.forward</code> makes it go forwards
2 The plane is going too fast	Slow the plane down to a manageable speed	If you multiply a value by <code>Time.deltaTime</code> , it will change it from 1x/frame to 1x/second
3 The plane is tilting automatically	Make the plane tilt only if the user presses the up/down arrows	In <code>PlayerControllerX.cs</code> , in <code>Update()</code> , the <code>verticalInput</code> value is assigned, but it's never actually used in the <code>Rotate()</code> call
4 The camera is <i>in front of</i> the plane	Reposition it so it's beside the plane	For the camera's position, try <code>X=30</code> , <code>Y=0</code> , <code>Z=10</code> and for the camera's rotation, try <code>X=0</code> , <code>Y=-90</code> , <code>Z=0</code>
5 The camera is not following the plane	Make the camera follow the plane	In <code>FollowPlayerX.cs</code> , neither the plane nor offset variables are assigned a value - assign the plane variable in the camera's inspector and assign the <code>offset = new Vector3(30, 0, 10)</code> in the code

Bonus Challenge	Task	Hint
X The plane's propeller does not spin	Create a script that spins the plane's propeller	There is a "Propeller" child object of the plane - you should create a new "SpinPropellerX.cs" script and make it rotate every frame around the Z axis.
